

# Energy profile of the citizens of Amaroussion

Results of 1<sup>st</sup> Questionnaire

December 2009

 The main objective of the current research is to obtain significant conclusions from the opinions of the citizens in the Amaroussion Municipality regarding the applicability of various energy saving and renewable energy techniques at home, problems and aspirations identified by public opinion and suggestions towards their resolution.

- It has been asked from 100 citizens to complete a properly designed questionnaire.
  - Effective sample: 63 participants sent back the completed questionnaire back
- A smaller sample of 30 volunteers participated in the recording of household electricity consumption which was conducted by CRES on behalf of the Municipal Development Company of the Municipality of Amaroussion (DEADA).
- As the questionnaire was self-completed, not all questions have been answered by the total number of participants

### Sample characteristics: questionnaire participants (n=63)

#### Stated Income (€/month)

- 500	-
501-1000	11%
1001-1500	20%
1501-2000	9%
2001-2500	16%
2501-3000	11%
3001-3500	11%
3501-4000	4%
4001-4500	-
4501-5000	-
5001-5500	4%
5501-6000	2%
6000+	11%

#### General

No of people/households reached		63
Average number of people per household		2,3
Average children per household		1,5
Ownership	owned	79%
Ownership	rented	21%

#### Year the residence was built

- 1944	2%
1945 - 1979	25%
1980 - 1999	40%
After 2000	33%

### Sample characteristics: measuring campaign participants (n=30)

#### Stated Income (€/month)

- 500	-
501-1000	18%
1001-1500	5%
1501-2000	18%
2001-2500	23%
2501-3000	5%
3001-3500	23%
3501-4000	-
4001-4500	-

#### General

No of people/households reached		30
Average number of people per household		2,9
Average children per household		1,5
Ownership	owned	71%
	rented	29%

#### Year the residence was built

- 1944	4%
1945 - 1979	11%
1980 - 1999	59%
After 2000	26%

## Main Findings: measurement campaign

### Abbreviations

- RES: Renewable Energy Sources
- EE: Energy Efficiency
- Min: minimum
- Max: maximum
- TV: television
- DVD: Digital Video Disc
- PC: Personal Computer
- ECO: a prefix relating to ecological terms
- LAN: Local Area Network
- Hi Fi: High Fidelity (here referring to high-quality reproduction of sound by home stereos)
- LCD: Liquid Crystal Display (here referring to TV)
- PV: photovoltaic

Hourly power consumption profile for the average day of the sample

The lowest values are observed during nighttime from 24:00 to 06:00, followed by a peak value at ~8:00 in the morning (morning activities) and a second peak around 14:00-15:00 (cooking activities). The max power consumption can be found during afternoon and evening hours until 23:00 (residents at home).

Watt/hour 0.00

#### Power Consumption Profile - Average Day of the sample

Profile similar to the previous one, presenting increased energy demand in the afternoon and morning hours and lower energy demand during the night (24:00 - 07:00).

Daily energy consumption profile - Typical dwelling in the sample

There is a slight differentiation between working days and weekends, with a special increase on Saturday in the morning hours (09:00-14:00).

![](_page_19_Picture_0.jpeg)

Most respondents possess a washing machine, a refrigerator and a TV (>80%). More than half own a stereo, a DVD recorder/player, a printer, a laptop, a monitor, a PC, an air-conditioner, an internet connection and a dishwasher.

![](_page_19_Figure_2.jpeg)

![](_page_20_Picture_0.jpeg)

Almost half clean the grid on the back of the refrigerator once a year and half never clean it; it seems that they do not know the usefulness of this action. Most refrigerators have an automatic defrost operation and the other are being defrosted basically once a year. Refrigerators usually operate in the middle temperature and are located away from cooking appliances.

![](_page_20_Figure_2.jpeg)

![](_page_20_Figure_3.jpeg)

How often do you clean the grid at the back of the refrigerator? / defrost? How do you adjust the thermostat?

Is your refrigerator is located across a cooking appliance?

Average storage capacity: 384 It

![](_page_20_Figure_7.jpeg)

#### Refrigerator located across cooking appliance

![](_page_20_Figure_9.jpeg)

![](_page_21_Picture_0.jpeg)

3 in 4 freezers do not have a automatic defrost operation and are being defrosted once a year. The thermostat is set to middle position. Most freezers are placed away from cooking appliances

![](_page_21_Figure_2.jpeg)

![](_page_21_Figure_3.jpeg)

![](_page_21_Figure_4.jpeg)

![](_page_21_Figure_5.jpeg)

How often do you defrost the freezer(s)? How do you adjust the thermostat? Is your freezer is located across a cooking appliance? General Questions for Refrigerators/Freezers

The majority of respondents do not place hot food in the fridge / freezer. Only 4% place uncovered utensils in the fridge / freezer. 74% are checking the energy label before buying a new refrigerator or a freezer.

![](_page_22_Figure_2.jpeg)

![](_page_22_Figure_3.jpeg)

Do you put cooked food in the refrigerator / freezer before it has cooled? / cover the dishes before putting them in the refrigerator / check the energy label when purchasing a refrigerator / freezer?

KAITE CRES

### Washing Machines

Most respondents tend to fill their washing machine at ~75% of their volume. None of them is using a washing temperature of >60° C, with the most washing at 40° C. Half washing machines do not have an ECO button and these that have one are not always operated in the economy mode by the users. The vast majority does not fold the clothes before putting them in the washing machine. Few are these that supply the washing machine with warm water

![](_page_23_Figure_2.jpeg)

At what temperature do you wash the clothes? / how much do you load the washing machine? / Do you fold the clothes before putting them in the machine? Do you use the ECO button? / Do you supply the washing machine with hot water?

KAITE CRES

![](_page_24_Picture_1.jpeg)

The frequency of dryer usage is a function of sunlight: it is mainly used during Winter and secondarily during the Fall.

![](_page_24_Figure_3.jpeg)

### Dishwashers

Most try to fill their dishwashers. The washing temperature varies. Only 12% are sure that their dishwasher is supplied with preheated water. A substantial proportion is using the ECO button (if it exists) in their systems. 72% checked the energy label of their dishwasher when buying it.

![](_page_25_Figure_2.jpeg)

To which % do you intend to load your dishwasher? / do you feed your dishwasher with hot water? / At what temperature do you operate the dishwasher? Do you use the ECO button? / do you check the energy label when purchasing a dishwasher? / Do you rinse the dishes before putting them in the dishwasher?

26

KAITE CRES

PEPESEC

![](_page_35_Picture_0.jpeg)

Half respondents tend to leave the lights on in empty rooms, however half usually replace the conventional bulbs with low-consumption ones. Those who do not replace them, claim that either the light quality is poor, they are expensive, or they do not like their appearance. The majority of those who replace them have not changed their lighting habits since.

![](_page_35_Figure_2.jpeg)

### Reasons not replacing with low-consumption bulbs

![](_page_35_Figure_4.jpeg)

#### Replace bulbs with low-consumption ones

![](_page_35_Figure_6.jpeg)

#### Change in lighting behavior since replacement

![](_page_35_Figure_8.jpeg)

Do you leave the lights on in an empty room? / replace light bulbs with low-consumption ones / Why not? / Have you changed your lighting habits since you replaced the bulbs with low-consumption ones?

### Lighting: types of bulbs

The living room is the one with the most light bulbs. Almost 1 in 2 are using incandescent bulbs across the household, albeit to a lesser extent in the kitchen, where low consumption halogen are dominant.

![](_page_36_Figure_2.jpeg)

![](_page_36_Figure_3.jpeg)

Light bulb types per room

#### Light bulb types (irrespective of room)

![](_page_36_Figure_5.jpeg)

37 n=63

KAITE CRES

PEPESEC

![](_page_37_Picture_1.jpeg)

Commodity characteristics are ranked as the most important ones when purchasing an electric appliance. Electrical consumption is ranked 1<sup>st</sup> only by 5% of the respondents.

![](_page_37_Figure_3.jpeg)

![](_page_38_Picture_1.jpeg)

4 in 10 believe that the major reason it is important to save energy is not to deplete the energy resources. The green house effect and economy follow.

![](_page_38_Figure_3.jpeg)

![](_page_39_Picture_0.jpeg)

### Awareness and information about environmental issues and energy

![](_page_40_Picture_0.jpeg)

Participants believe that the Economy is the most fundamental issue fretting Greece today, followed at a distance by the Environment and the Educational system.

![](_page_40_Figure_2.jpeg)

![](_page_41_Picture_1.jpeg)

Participants claim to be more informed on solar (heating water) energy and burning gas / gasoline, both being energy forms used in their every day life. To the contrary, more than half are not informed at all on fuel cells.

![](_page_41_Figure_3.jpeg)

![](_page_42_Picture_1.jpeg)

Solar energy for heating water together with wind power and energy from PV plants receive the most support for usage in Greece. On the other hand are nuclear power with energy from lignite and oil or gasoline. The skepticism towards the other lesser known RES is clearly evident.

![](_page_42_Figure_3.jpeg)

#### Degree of information on each energy type vs. Attitudes towards their usage in Greece Top box and Bottom box

![](_page_43_Picture_1.jpeg)

It seems that attitudes towards the use of various energy types are a function of either (a) the degree of information for each (i.e., the more they feel informed, the more positive they are towards their application in Greece) such as PV plants, (b) how familiar they are with them on a day-to-day basis such as solar for heating water and burning oil & gasoline, and (c) whether the type of energy is considered to be "mild",

![](_page_43_Figure_3.jpeg)

![](_page_44_Picture_0.jpeg)

In consumers' perceptual framework, although without 3 prominent energy types that are mostly used in Greece, burning oil and gasoline comes first.

![](_page_44_Figure_2.jpeg)

![](_page_45_Picture_0.jpeg)

Half place Industry & Tourism as the largest energy consumer in Greece. Only 16% believe it is the households; this may hinder their efforts for change in energy consumption due to the low weight of the percentage  $\rightarrow$  further education (actual percentage is 25%) can lead to more internalized locus of control and thus meeker energy consumption.

![](_page_45_Figure_2.jpeg)

KAITE CRES

![](_page_46_Picture_0.jpeg)

Promotion of RES is perceived as the top priority objective for the Greek energy policy, followed closely by development of energy autonomy of the country.

![](_page_46_Figure_2.jpeg)

6 in 10 claim to have substituted common light bulbs with low consumption ones and also to have reduced central heating and air conditioning usage.

![](_page_47_Figure_3.jpeg)

Membership in environmental organization and information on environmental and energy issues

The vast majority is not a member of any environmental organization, however most claim to get informed on environmental issues, mainly through TV and newspapers.

![](_page_48_Figure_2.jpeg)

Members of environmental organization

![](_page_48_Figure_4.jpeg)

#### Most trusted info source for energy issues

![](_page_48_Figure_6.jpeg)

Willingness to pay more for electricity coming from RES and opinion leadership

![](_page_49_Picture_1.jpeg)

45% are willing to pay more for RES descendant electricity, among which, 1/3 believe that they can influence others to join them in being willing to pay. 4 in 10 regard themselves as early adopters (actual percentage in general population is 14%).

Pay more for electricity because it comes from RES

![](_page_49_Figure_4.jpeg)

Can they influence others on this?

![](_page_49_Figure_6.jpeg)

#### Degree to which they believe they are early adopters

![](_page_49_Figure_8.jpeg)

Are you willing to pay more for electricity because it comes from RES? / If yes, do you reckon you can also influence others on this? / Do you generally like to be of the first to try a new product / service?

![](_page_50_Picture_0.jpeg)

## Summary

![](_page_51_Picture_0.jpeg)

- The general conclusion is that most citizens are not adequately informed on environmental and energy saving issues, which is evident either in their energy consumption habits or their beliefs and attitudes. Regarding their energy consumption habits...
  - 1 in 2 never cleans the refrigerator grid
  - 1 in 4 does not check the energy label of the fridge / refrigerator and 3 in 10 for the dishwashers
  - 6 in 10 do not fully load the washing machine
  - 6 in 10 do not always place the lid while cooking
  - Energy classes A++ and A+ are found only at 1 in 10 refrigerators, while quite a few are not aware of the exact energy class of the appliances
  - 3 4 in 10 do not use the energy saving function on their monitor / PC
  - The majority is not aware of the "energy star" label meaning in PCs and monitors
  - Half are not aware that the screen savers actually saves energy
  - 1 in 4 does not know that some appliances use up electricity even if they are turned off but not unplugged
  - 6 in 10 do not unplug the chargers (mobile, laptop) when not in use
  - 1 in 4 leave open doors when air conditioning is on
  - 1 in 2 leaves lights turned on in empty rooms

![](_page_52_Picture_0.jpeg)

- Regarding their attitudes, although 92% claim to be informed on environmental issues...
  - Only 5% rank "electrical consumption" as the 1<sup>st</sup> most important selection criterion when purchasing an electric appliance.
  - Almost 7 in 10 believe that the Economy is the major issue tantalizing Greece (as opposed to 24% that believe it is the Environment)
  - They report ignorance concerning most RES
  - Attitudes towards the use of various energy types are a function of either (a) the degree of information for each (i.e., the more they feel informed, the more positive they are towards their application in Greece) such as PV plants, (b) how familiar they are with them on a day-to-day basis such as solar for heating water and burning oil & gasoline, and (c) whether the type of energy is considered to be "mild", such as wind and tidal energy.
  - Only 16% believe the households are the main energy consumers; this may hinder their efforts for change in energy consumption due to the low weight of the percentage. Further education is needed (actual percentage is 25%) to lead to more internalized locus of control and thus meeker and more responsible energy consumption.
